In a regenerative braking scenario, 2.9 V is fine as the maximum charging voltage. But in a solar installation or as a car battery, that is charged with a constant voltage of e.g. 14.4 V, it is better to use a 6S instead of a 5S battery pack. With 14.4 V constant charge voltage of the car alternator: 5S: 2.88 V / cell 6S: 2.40 V / cell

Those multiple of 12 (6x12) are legacy from the lead-acid battery era, they have little (but potentially dangerous) meaning in the Lithium world. How many cells in series in your pack? 22 (72.6V nominal, 79.2 max for A123), 23 (75.9V, 82.80), 24 (79.2, 86.4), etc... So if your pack is 23s and you try to charge it to 86.4, well, good luck with that.

for 7S~24 series cell protection for Lithium or Lifepo4 Battery pack (for example 15*4.2=63V 12*3.65=43.8V Lifepo4 battery pack example),client can select suitable type based on your battery characteristics Dimension (L*W*T)=128*70*15mm Various protection functions for charging and discharging (over-charge, over-discharge,high or Low temperature protection ...
