

Apu outdoor power supply

What is an auxiliary power unit (APU)?

Auxiliary power units (APUs) are very important technical assets. Some consider them as big components, others as small engines. They provide the necessary independent power supply for your aircraft during ground time.

What are the features of an APU?

... spool-driven load compressor, main engine start capability, and electrical power from two gearbox-mounted, 120kVA generators. The APU is also designed to deliver in-flight backup power. ... competitive units on the market.

How does the APU (Auxiliary Power Unit) work?

The APU (Auxiliary Power Unit) in The Dewey Electronics Corporation's system can be started remotely within the vehicle. It operates on diesel and JP-8 fuels and provides 28V DC output at the NATO Slave connector. Quick disconnect fuel lines allow connection to the vehicle fuel supply. Other output power terminations are available upon request.

How many auxiliary power units are there?

More than 20 models of the 36-150 auxiliary power units (APUs) used today have proven on-wing reliability, superior efficiency, and great power-to-weight ratio for multiple ... spool-driven load compressor, main engine start capability, and electrical power from two gearbox-mounted, 120kVA generators.

Why should you choose APU maintenance facilities?

Some consider them as big components, others as small engines. They provide the necessary independent power supply for your aircraft during ground time. The competence and capabilities of our APU maintenance facilities are based not least on our globally recognized accomplishments in the repair and overhaul of main aircraft engines.

What is a Honeywell APU?

Honeywell APUs continue to be the strong selection preference for high-volume platforms like the Boeing B737 and Airbus A320. With our broad range of applications, we can support power requirements from 50 equivalent shaft horsepower up to 1700 equivalent shaft horsepower.

If APU is connected, and NO IDG are in operation then: - BTB closes and APU supplies power to AC TRANSFER BUS 1 & 2
If one IDG is connected then: - The BTB opens and the IDG supplies power to its related AC TRANSFER BUS - APU supplies power to the other AC TRANSFER BUS.
If the other IDG is connected then: - the BTB opens and isolates the TIE BUS
