What type of fossils are found near Bloemfontein?

In the absence of good, fresh bedrock exposure, as in the present study area near Bloemfontein, the main category of fossils found regionally comprises resistant-weathering blocks of petrified (silicified) wood that have been reworked by weathering and erosion into the overlying superficial sediments, viz. alluvium and downwashed surface gravels.

What type of soil does Sonneblom spp project have?

Figure 7: Typical flat, grassy terrain with scattered domical termitaria seen in the Sonneblom SPP project area. Bedrock exposure here is effectively zero in all seasons due to pervasive thick soil cover.

Is Sonneblom spp a fossil?

While the Sonneblom SPP project area overlies potentially fossiliferous Late Permian continental sediments of the Adelaide Subgroup (Lower Beaufort Group) at depth, the bedrocks are nowhere exposed here due to pervasive, thick soil and grassy vegetation cover. No substantial Late Cenozoic alluvial deposits were identified during the site visit.
