Does air-cooling pack design affect thermal management of lithium-ion batteries?

This research examines the impact of a unique air-cooling pack design on the thermal management system for 52 lithium-ion battery cells. The space between the batteries was simulated by employing air as a cooling fluid to remove the heat from lithium-ion batteries by moving air inside the cooling pack ( $S = 2$  mm).

Why do we need a thermal model analysis for lithium-ion batteries?

The operating temperature is determined by the balance between the heat generation and the heat dissipation. Thus, the thermal model analysis is required to properly deal with the boundary conditions to avoid the distorted results. Hatchard et al. presented a cylindrical lithium-ion battery thermal model.

What is a cylindrical lithium-ion battery thermal model?

Hatchard et al. presented a cylindrical lithium-ion battery thermal model. This model considered the cylinder as a series of concentric rings. A 1-dimensional numerical scheme was established at the radial direction. The dissipating heat transfer coefficient is made up of all heat flow in terms of conduction, convection and radiation.

What is a cylindrical lithium battery?

A typical cylindrical lithium battery is spiral rolls cells shown in Fig. 2. Thin layers of cathode, separator, current collector, and anode are rolled up on central mandrel and inserted into a cylindrical can. The gaps are filled with liquid electrolyte.

What is a lithium ion battery self-discharge rate?

Self-discharge rate: The self-discharge rate of a lithium-ion battery is the rate at which it loses its charge when not in use. It is typically measured in percent per month and can range from 1 to 2% per month for high-quality batteries to 10% or more per month for lower-quality batteries.
