What is energy storage system capacity cost?

Energy storage system capacity cost as a function of energy storage roundtrip efficiency for various technologies (boxes) compared to breakeven capacity costs for various loan periods (LP).

Can energy storage systems generate arbitrage?

Conclusion Due to the increased daily electricity price variations caused by the peak and off-peak demands, energy storage systems can be utilized to generate arbitrage by charging the plants during low price periods and discharging them during high price periods.

How efficient are energy storage systems?

The overall efficiency is a critical factor to judge energy losses during storage and regeneration for the energy storage system and strongly influences the arbitrage strategy. For the storage systems considered herein, the reported overall efficiency ranges from 60% to 95% (Zakeri and Syri, 2015).

How do price differences influence arbitrage by energy storage?

Price differences due to demand variations enable arbitrage by energy storage. Maximum daily revenue through arbitrage varies with roundtrip efficiency. Revenue of arbitrage is compared to cost of energy for various storage technologies. Breakeven cost of storage is firstly calculated with different loan periods.

What is energy storage revenue based on price profile?

The revenue is considered as the income from the energy storage plant with various roundtrip efficiencies. Thus, an optimal methodology was developed to determine the largest revenue through the charging and discharging operations based on the price profile.

How can energy storage technologies be analyzed for maximum profitability?

Based on the above arbitrage revenue and capacity costs, the potential selections of energy storage technologies can be analyzed in more detail for maximum profitability once breakeven costs are achieved via attainment of technology readiness and/or system cost reductions.
