The discharging current will be based on the load, I.E. for inverter to supply 5000W to the AC load, the input power to the inverter will be more than 5000W due to system and conversion loss (typical you will get 85% of what you put into the inverter), so $5000W/0.85 = 5882W$, so if the battery is 48V then the current draw from the battery will be $5882W/48V = 123A$.
