What is a hybrid inverter?

A hybrid inverter is essentially two inverters in one. It combines a solar inverter and a battery inverter into one simple unit. Hybrid inverters use solar energy to power your home, charge a battery, or send excess energy into the electricity grid. They also provide emergency backup power during a blackout.

What can a hybrid inverter do with excess solar energy?

Hybrid inverters can send excess energy into the electricity grid or charge a battery. They are essentially two inverters in one; they combine a solar inverter and a battery inverter into one simple unit. These advanced inverters use solar energy to power your home and provide emergency backup power during a blackout.

Can a microinverter charge a battery from a hybrid inverter?

Bringing the AC output from microinverters directly to the hybrid inverter offers a key benefit: you can charge your battery from the microinverter. It is important to distinguish between configuring your hybrid inverter to charge from the generator or auxiliary AC input (where your microinverters are connected) versus charging from the grid.

Do hybrid inverters support AC input from microinverters?

I looked for more examples of hybrid inverters and their support for AC input from microinverters or string inverters. A quick check on City Plumbing's website, an established retailer of solar energy components in the UK, shows the following options for hybrid inverters.

Should I use a microinverter or a hybrid inverter?

When your existing strings occupy all of the available MPPTs on your inverter, you can expand with microinverters. Bringing the AC output from microinverters directly to the hybrid inverter offers a key benefit: you can charge your battery from the microinverter.

Can I use a hybrid inverter instead of an AC?

Instead of delivering the AC to your home, you can plug it into your hybrid inverter. Please note, only some hybrid inverters support AC-coupled external sources such as microinverters or string inverters. When your existing strings occupy all of the available MPPTs on your inverter, you can expand with microinverters.

Unlike string inverters, microinverters are much smaller and are placed on the back of each solar panel. They convert each panel's DC to AC at the source of creation. Each microinverter works independently from the rest of the panels, converting the amount of energy that each solar panel is generating. Microinverters tend to cost a bit more.
