What is the control design of a grid connected inverter?

The control design of this type of inverter may be challenging as several algorithms are required to run the inverter. This reference design uses the C2000 microcontroller(MCU) family of devices to implement control of a grid connected inverter with output current control.

Does an inverter control algorithm work with open-loop power supply?

This study describes the design and implementation of an inverter control algorithm with both the inverter inner controllable impedance and governor-free characteristics. The inverter controlled as a voltage supply works with open-loop power control in grid-connected operation.

Can a grid connected inverter be left unattended?

Do not leave the design powered when unattended. Grid connected inverters (GCI) are commonly used in applications such as photovoltaic inverters to generate a regulated AC current to feed into the grid. The control design of this type of inverter may be challenging as several algorithms are required to run the inverter.

How to design a grid-friendly inverter?

On the basis of the basic imagine of a power grid model, a grid-friendly inverter is designed by the proposed control algorithm and the design concept is shown in Fig. 1. The PCS with local loads is connected in parallel with other generator systems through line impedance Z_l and the grid through grid impedance Z_g .

Can a grid connected inverter be used as a voltage supply?

It is well known that it is much easier to control a grid-connected inverter as a current supply than to control it as a voltage supply . For standalone operation or connected with the weak grid,however,only a VCI can supply loads with regulated voltage.

Can a grid connected inverter synchronise exactly with the grid frequency?

A grid-connected inverter is requested to synchronise exactly with the grid frequency[11,12]. Frequency synchronisation of three-phase inverters can be realised through phase-locked loop (PLL) control based on the dq transformation [13 - 15].

Because the grid synchronization link will affect the characteristics of the system at low frequency. Specifically, the low-frequency output impedance of the grid-connected inverter will be reflected by the PLL [3], [4], [5]. Under significant changes in the grid impedance, the inverter has a low harmonic or instability close to the PLL bandwidth (generally within 200 to 700 Hz).
