Can You charge a car battery while connected to an inverter?

Charging your deep cycle or car battery while connected to an inverter can help you to run your appliances while the battery is getting power from the solar panels or charging. So in this blog post, I'll explain about charging your battery when it's connected to an inverter and what to keep in mind before doing this method, and much more...

How does an inverter charge a battery?

As the battery's SOC increases, the charging current gradually decreases. Once the battery reaches a specific voltage threshold, the inverter charger switches to absorption charging mode. In this phase, the charger maintains a constant voltage while gradually reducing the charging current. The battery continues to charge, albeit at a slower pace.

How do you charge a battery with a solar inverter?

To address this, solar power is the most preferred method for charging the battery while using the inverter, especially in off-grid situations or during power outages. Setting up a solar charging system involves using a solar panel, a solar charge controller, and proper battery connections.

Will a 150W inverter charge a battery at 10a?

I presume that 150W is at 220V. Once that is fed into your battery charger you'll lose 10% - 20% power, so your battery charger will output 120W to 135W at your battery charging voltage - somewhere between 13 & 14.5V, I would guess. So, realistically, your 150W inverter will be lucky to charge your aux battery at 10A.

How does an inverter charger work?

The charger monitors the battery's voltage and adjusts the charging current accordingly. As the battery's SOC increases, the charging current gradually decreases. Once the battery reaches a specific voltage threshold, the inverter charger switches to absorption charging mode.

Is it safe to charge a battery while the inverter is connected?

In short, yes, it is safe to charge your battery while the inverter is connected. But the only thing to keep in mind is that the load connected with the inverter should be even to the input of DC power to the battery from the solar panels.

This position ensures that the battery does not discharge over the storage period. When the RV is stored and not being used for an extended time, disconnecting the battery is crucial to maintain its charge. Before you resume using your RV, simply turn the disconnect to "on" to allow the battery to charge from shore power or while driving.
