Why is energy storage important for off-grid systems?

While storage value has been identified in many cases, three use cases are essential when it comes to off-grid systems: power quality, power reliability, and balancing support. Indeed, energy storage can enable time shifting at the time of excess low cost generation and the release of energy in times of peak demand [7].

To face the time and location dependency of solar energy, an off-grid PV system would require energy storage in a battery. The optimal design of an off-grid PV-battery system would also be necessary to use the available solar energy efficiently and satisfy the user's energy demand in terms of optimal capacities of PV array and battery storage.

In the off-grid PV scenario, the design of an energy-storage system should both consider electric- and cooling-mismatch problems. Because only the battery can solve these problems simultaneously, the configuration of an off-grid PV system with CTES should keep the battery (at least).

Combining a BT and a PV system for energy storage in both on-grid and off-grid scenarios involves a set of equations for modeling the system. These equations describe the balance of energy flow, power conversions, state-of-charge (SOC) of the battery, and interaction with the grid or load. Below is a simplified framework for
