Are residual voltages and currents in power lines a problem?

In the problem of inductive coordination of power and communication systems, residual voltages and currents in the power lines are an important element; yet it is apparent that they are not, in general, well understood. Studies have been made, and others are under way by well-equipped organizations, which will add much to the data concerning them.

Why are solar PV generators different under normal conditions?

The voltage and reactive power response of solar PV generators under both normal and outage conditions hence may be different. The voltage level to which the solar PV generators interconnect is another factor that may cause the difference.

What is a residual voltage in an alternator?

ted output voltage as a residual voltage level. If the alternator is a high voltage (HV) type, then so e 2kV could be present at the output terminals. Accidental contact with such a voltage level must be avoided. When low levels of residual voltage are measured, they can be a warning that the alternator has an internal fault.

Can a solar PV generator be connected to a transmission system?

Solar PV (Photovoltaic) generators can be connected to a transmission system as a large scale installation or distributed across a distribution system close to load. Both types of solar PV projects utilize full converter model to connect to the grid, but may have different reactive power capabilities.

Are PV power generators reliable?

However, the generators are highly vulnerable and sensitive to the partial shading that results in overall system performance deterioration. In this paper, the reliability of these PV power generators is evaluated under various static and dynamic shading scenarios using MATLAB/Simulink and real-time prototype.

What is the difference between a solar PV generator and a converter?

Both types of solar PV projects utilize full converter model to connect to the grid, but may have different reactive power capabilities. The voltage and reactive power response of solar PV generators under both normal and outage conditions hence may be different.
