Supercapacitors, compared to capacitors, have a larger area for storing more charge, with capacitance into the farad (F) range, and they store more energy than electrolytic capacitors. They have a low leakage current and are suitable for many applications that can operate in the 1.8V - 2.5V range.

Nowadays, the energy storage systems based on lithium-ion batteries, fuel cells (FCs) and super capacitors (SCs) are playing a key role in several applications such as power ...

seperti EDLC (Electric / Electrochemical Double Layer Capacitor), electrochemical capacitor, maupun ultracapacitor . Berbeda dengan kapasitor konvensional, superkapasitor memiliki nilai kapasitansi

So, if we increase the capacitance the stored energy Q will also increase. The unit of capacitance is Farad (F) which is named after M. Faraday. Farad is the capacitance unit in respect of coulomb/volt. If we say a capacitor with 1 Farad, then it will create a 1-volt potential difference between its plates depending on the 1-coulomb charge.

For super-capacitors, if the internal resistance is (5-10) m Ω or less, then one can pump even 10 Amp to charge while the capacitors will dissipate less than 1Watt. This was never possible before for any energy storage devices. The super-capacitor also found to have high power density, short charging time, as described above, and also eco-friendly.
