Should solar energy be combined with storage technologies?

Sometimes two is better than one. Coupling solar energy and storage technologies is one such case. The reason: Solar energy is not always produced at the time energy is needed most. Peak power usage often occurs on summer afternoons and evenings, when solar energy generation is falling.

Can solar energy be used as a energy storage system?

Existing compressed air energy storage systems often use the released air as part of a natural gas power cycle to produce electricity. Solar power can be used to create new fuels that can be combusted (burned) or consumed to provide energy, effectively storing the solar energy in the chemical bonds.

Why is solar storage important?

Storage helps solar contribute to the electricity supply even when the sun isn't shining. It can also help smooth out variations in how solar energy flows on the grid. These variations are attributable to changes in the amount of sunlight that shines onto photovoltaic (PV) panels or concentrating solar-thermal power (CSP) systems.

Additionally, application-specific duty-cycle performance tests are provided for a number of grid services including e.g. frequency regulation, peak shaving and PV smoothing. The energy storage system is considered a black box with power exchange between the energy storage system and the grid being measured [53].
