

Wind power generation

What is wind power generation?

Wind power generation is the process of converting wind energy into electric energy. This is achieved by using a wind generating set that absorbs wind energy with a specially designed blade, converting it to mechanical energy, which then drives a generator to produce electricity.

How does a wind turbine generate electricity?

Wind turbines convert the kinetic energy of moving air into electricity. As the blades of a wind turbine are set in motion, their rotation turns a turbine. This rotational energy moves the shaft connected to the generator, producing electrical energy.

What is wind power?

Wind power is a form of energy conversion in which turbines convert the kinetic energy of wind into mechanical or electrical energy that can be used for power. Wind power is considered a form of renewable energy. Modern commercial wind turbines produce electricity by using rotational energy to drive a generator.

What is wind energy?

Wind energy is considered one of the most developed and cost-effective renewable energy technologies, which is now generally competitive with electricity produced by conventional power plants. Wind turbines can be situated either onshore or offshore.

What are the benefits of wind power generation?

Wind power generation is one of the most mature and promising power generation methods. It has the advantages of being clean and pollution-free, low power generation cost, less actual land occupation and simple operation.

What is wind power and why is it important?

Wind power is a type of renewable energy that harnesses the kinetic power of wind for electricity generation. As one of the largest sources of sustainable and clean energy, wind power is essential to the journey towards net zero emissions. Humans have used wind energy for mechanical purposes since antiquity, using simple windmills to pump water.

Wind power generation forecasts are based on wind forecasts and wind turbine locations, size and capacity. The day ahead forecast is published every day at 12 EET and is not updated after publication. Overlapping hours are overwritten the following day. The continuously updated forecast is calculated and updated every hour for the next 72 hours.

Wind power generation means getting the electrical energy by converting wind energy into rotating energy of the blades and converting that rotating energy into electrical energy by the generator. Wind energy increases with the cube of the wind speed, therefore WTGs should be installed in the higher wind speed area.

It usually is characterized by one or several small wind turbines that provide on-site wind power generation to individual homes, manufacturing sites, agricultural areas or rural communities. In addition to on-site generation, distributed wind energy can also connect to microgrids and hybrid energy systems. Distributed wind energy installations ...
