Are low-temperature lithium batteries dangerous?

In general, there are four threats in developing low-temperature lithium batteries when using traditional carbonate-based electrolytes: 1) low ionic conductivity of bulk electrolyte, 2) increased resistance of solid electrolyte interphase (SEI), 3) sluggish kinetics of charge transfer, 4) slow Li diffusion throughout bulk electrodes.

Why are low-temperature lithium batteries better at room temperature?

This superior low-temperature battery performance was mainly attributed to the unique solvation structure of the obtained super-electrolyte. However, this electrolyte goes for the cells at very low area capacity of 1.2 mAh cm^{-2} , which is much lower than that (5 mAh cm^{-2}) of commercialized lithium batteries at room temperature.

How to extend the service-temperature range of lithium batteries?

Formulating electrolytes with solvents of low freezing points and high dielectric constants is a direct approach to extend the service-temperature range of lithium batteries. However, the SEI formed by the decomposition products of common electrolytes cannot satisfy the electrochemical properties at ultralow temperature.

Are lithium-ion batteries able to operate under extreme temperature conditions?

Lithium-ion batteries are in increasing demand for operation under extreme temperature conditions due to the continuous expansion of their applications. A significant loss in energy and power densities at low temperatures is still one of the main obstacles limiting the operation of lithium-ion batteries at sub-zero temperatures.

Can Li stabilizing strategies be used in low-temperature batteries?

The Li stabilizing strategies including artificial SEI, alloying, and current collector/host modification are promising for application in the low-temperature batteries. However, expeditions on such aspects are presently limited, with numerous efforts being devoted to electrolyte designs. 3.3.1. Interfacial regulation and alloying

Are lithium-ion batteries a good energy storage device?

Owing to their several advantages, such as light weight, high specific capacity, good charge retention, long-life cycling, and low toxicity, lithium-ion batteries (LIBs) have been the energy storage devices of choice for various applications, including portable electronics like mobile phones, laptops, and cameras.

The poor low-temperature performance of lithium-ion batteries (LIBs) significantly impedes the widespread adoption of electric vehicles (EVs) and energy storage systems (ESSs) in cold regions. In this paper, a non-destructive bidirectional pulse current (BPC) heating framework considering different BPC parameters is proposed.
